

**In the Abstract**

Please amend the abstract as follows:

Rating limits, which define whether programs are to be blocked or are deemed to be acceptable, are selected in a program content filtering system. ~~For that purpose information~~ Information about a rating example is reproduced and at least one recommended rating assigned to the rating example is supplied. An user indication about the acceptability of ~~said~~ the rating example is detected and assigned to the recommended rating. A rating limit is derived in response to the user indication. The above steps can be repeated if needed to provide sufficient data to enable deriving one or more rating limits from the user indications assigned to the ratings.
